

Email Wake-Up Agent

An autonomous email agent that talks to prospects, negotiates, and books calls.

ROLE	TIME BOX	STACK	SUBMISSION
AI Fullstack Engineer	3 – 5 days	Your choice	GitHub + Loom

OBJECTIVE

Build an **Email Wake-Up Agent** that initiates and sustains an email conversation with a prospect about a work gig we are offering. The agent's north-star goal is simple: **get the interested prospect to schedule a call**. It should negotiate within the budget we configure, handle objections, and keep full memory of every back-and-forth so the conversation always feels continuous.

WHAT THE AGENT MUST DO

- **Initiate outreach.** Send the first email to a prospect introducing the gig in a natural, non-spammy tone.
- **Hold a real conversation.** Read the prospect's reply, understand intent (interested / curious / objecting / declining / silent), and respond appropriately.
- **Negotiate within budget.** If the prospect quotes a rate or pushes back on terms, negotiate against a configured budget ceiling. Never exceed it. Walk away politely if there's no fit.
- **Drive toward a scheduled call.** Once the prospect shows interest, propose times and lock a slot. Treat scheduling as the primary success metric.
- **Persist full conversation memory.** Every email — sent and received — must be remembered. The agent should never repeat itself, contradict prior commitments, or lose context across a long thread.

CRITICAL USE CASE TO HANDLE

The reschedule loop. A prospect agrees to a call and proposes a time. Later (same thread or new one), they reply that they cannot make it anymore. The agent must recognize the cancellation, hold all earlier context, re-open the negotiation gracefully, propose new times, and lock a fresh slot — without sounding like a different person or starting from zero. This loop should work N times.

TECHNICAL EXPECTATIONS

- **Inbound + outbound email.** Use any provider (Gmail API, SendGrid, Resend, Mailgun, IMAP/SMTP). Demonstrate a real round-trip on a test inbox.
- **Agent loop.** LLM of your choice. Show how you structure prompts, tools, and state. Bonus for clean tool-use and clear separation of perception → reasoning → action.
- **Memory.** Persist threads in a store of your choice (Postgres, SQLite, Redis, vector DB — your call). Be ready to defend the design.
- **Calendar.** Booking can be a real integration (Google Calendar, Cal.com) or a stubbed slot picker — clearly mark which.
- **Configurability.** Gig description, budget ceiling, and tone should be config-driven, not hard-coded.

DELIVERABLES

- **GitHub repo** (public or shared) with a clear README — setup, architecture diagram, and trade-offs.
- **A 3–5 minute Loom** walking through the architecture and a live demo, including the reschedule loop.
- **Sample thread transcripts** showing at least: (1) a successful negotiation + booking, (2) a cancellation + re-booking, (3) a graceful walk-away.

HOW WE EVALUATE

- **Agent design — 35%.** How thoughtfully you decomposed perception, memory, planning, and action.
- **Conversation quality — 25%.** Does it sound like a sharp human? Does it stay on goal without being pushy?
- **Robustness of the reschedule loop — 20%.** Edge cases, repeated cancellations, ambiguous replies.
- **Code quality & fullstack chops — 20%.** Clean structure, sensible storage, reproducible setup.

Build the simplest version that genuinely works end-to-end before you optimize. We care more about a sharp, honest agent than a feature-rich one.
